MULTI–PHONE PROGRAMMING APPLI–CATION

Abstract

Automated Provisioning of radiotelephone handsets at a fulfill–ment center and automated quality assurance are disclosed. The provisioning uses a computer database of specifications for au–thentication and activation from multiple handset manufacturing vendors, radiotelephone service providers, and distributors. A universal interface system is provided to efficiently access diverse makes and models of handsets. The handsets are attached to the interface system in accordance with a build request, checked to see if the attached handset matches the build request, and auto–matically provisioned via the interface in accordance with the build request.
